ABSTRACT

The **Online Course Registration System** is a web-based application designed to simplify and automate the process of course enrollment for educational institutions. The system provides an efficient platform where students can view available courses, check course details such as duration, fees, and instructor information, and register for courses online. At the same time, administrators can manage courses, student information, and registrations through a centralized dashboard.

This system reduces manual paperwork, minimizes errors, and saves time by replacing the traditional offline registration process. It ensures secure user authentication, organized data storage, and easy retrieval of information using a database-driven approach. The application improves accessibility, transparency, and accuracy in course management, making the registration process faster and more reliable.

The Online Course Registration System is developed using web technologies such as HTML, CSS, JavaScript, PHP, and MySQL, making it cost-effective, user-friendly, and suitable for small to medium educational institutions.

Introduction

The Online Course Registration System is a web-based application developed to automate the process of course enrollment in educational institutions. The system allows students to view available courses, register online, and manage their enrollments, while administrators can add, update, and manage courses, users, and registrations efficiently.

This project reduces manual paperwork, saves time, minimizes errors, and provides a centralized platform for course management. The system ensures secure login, easy navigation, and real-time data handling using a database-driven approach.

Objectives of the Project

The primary objective of this project is to design and develop a **web-based Online Course Registration System** that enables users to access educational courses remotely. This platform will facilitate the management and delivery of course materials, user enrollments, lesson content, and payments in a structured and efficient manner.

Specific Objectives:

1. To provide an online platform for course registration.
2. To reduce manual work and paperwork in course enrollment.
3. To allow students to view course details such as duration, fees, and instructor.
4. To provide secure login and authentication for users and admin.
5. To enable administrators to manage courses and student records efficiently.
6. To maintain accurate and centralized course registration data.
7. To improve accessibility and transparency in course management.
8. To generate reports for registrations and enrolled students.

- # Modules

Module 1: User Authentication Module

Handles user registration, login, and logout functionality for students and admin.

Module 2: Course Management Module

Allows admin to add, update, delete, and view courses.

Module 3: Course Registration Module

Enables students to enroll in available courses online.

Module 4: Admin Panel Module

Provides administrative control over users, courses, and registrations.

Module 5: Database Management Module

Stores and manages all system data such as users, courses, and enrollments.

- # Scope and Functionality of Each Module

User Authentication Module

- User registration and login
- Role-based access (Admin / Student)
- Secure session management

Course Management Module

- Add new courses
- Update course details
- Delete courses
- View course list

Course Registration Module

- View available courses
- Enroll in selected courses
- Prevent duplicate registrations

Admin Panel Module

- View registered students
- Manage course enrollments
- Generate registration reports

Database Management Module

- Store user data securely
- Maintain course and enrollment records
- Ensure data consistency

Technology Used

A **System Requirement Specification (SRS)** outlines the essential hardware and software requirements necessary for the development, deployment, and operation of the Online Course Registration System. It ensures that the system runs efficiently and meets both functional and non-functional goals.

Hardware Requirements

Hardware refers to the tangible physical components of a computer system that are used to execute instructions. These components are essential to support both development and user interaction with the system.

Minimum Hardware Configuration:

This configuration ensures the system runs smoothly during both development and deployment phases.

- Processor: Intel Pentium or above
- RAM: Minimum 4 GB
- Hard Disk: Minimum 40 GB
- Internet Connection (Optional)

Software Requirements

Software comprises the programs and operating systems needed to develop, test, and run the Online Course Registration System. These tools form the foundation for building a fully functional and user-friendly learning management system.

- Operating System: Windows / Linux
- Web Server: XAMPP / WAMP
- Database Server: MySQL
- Programming Language: PHP
- Browser: Google Chrome / Mozilla Firefox

Limitations of the Proposed System

1. Payment gateway integration is not included.
2. No mobile application support (web-based only).
3. Limited scalability for large institutions.
4. No advanced analytics or AI-based recommendations.
5. Depends on internet connectivity for access.
6. Basic security features; advanced encryption not implemented.
